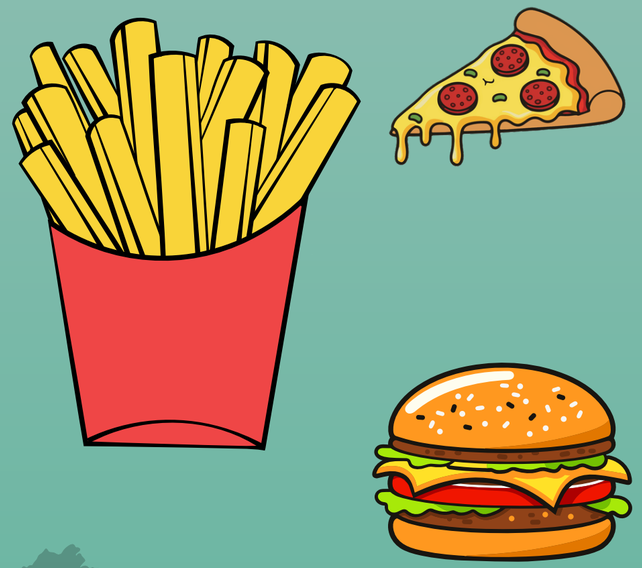
ZOMATO SALES ANALYSIS

ABOUT ZOMATO



Zomato is a leading online food delivery platform that connects customers with restaurants across multiple cities. It enables users to discover restaurants, browse menus, place orders, and get food delivered quickly, while helping restaurants expand their reach and grow revenue through digital ordering services.

10 July 2008

About the project

This project is based on Zomato food delivery data. The main aim was to understand sales, customer behavior, and restaurant performance. First, the data was cleaned using **Power Query** to remove errors and organize it properly. Then, **SQL** was used to find important insights like top restaurants, peak ordering time, revenue trends, and customer preferences. Finally, **Power BI** was used to create interactive **dashboards** to clearly show the results with charts and visuals.

The purpose of this project is to convert raw data into simple and useful business insights.

Key Business Problems

1. Which restaurants are generating the lowest revenue and why?
2. Are we too dependent on a few top-performing restaurants?
3. Do higher order volumes always result in higher revenue?
4. In which months is customer spending (AOV) lower?
5. Which cuisine is most preferred by customers?
6. Which cuisines are underperforming?
7. At what hours do we receive the highest number of orders?
8. Which states generate the highest and lowest revenue?
9. Which food items are most and least popular?
10. Who are our high-value customers?
11. How can we convert medium-value customers into high-value customers?
12. What factors are causing revenue fluctuations across months?

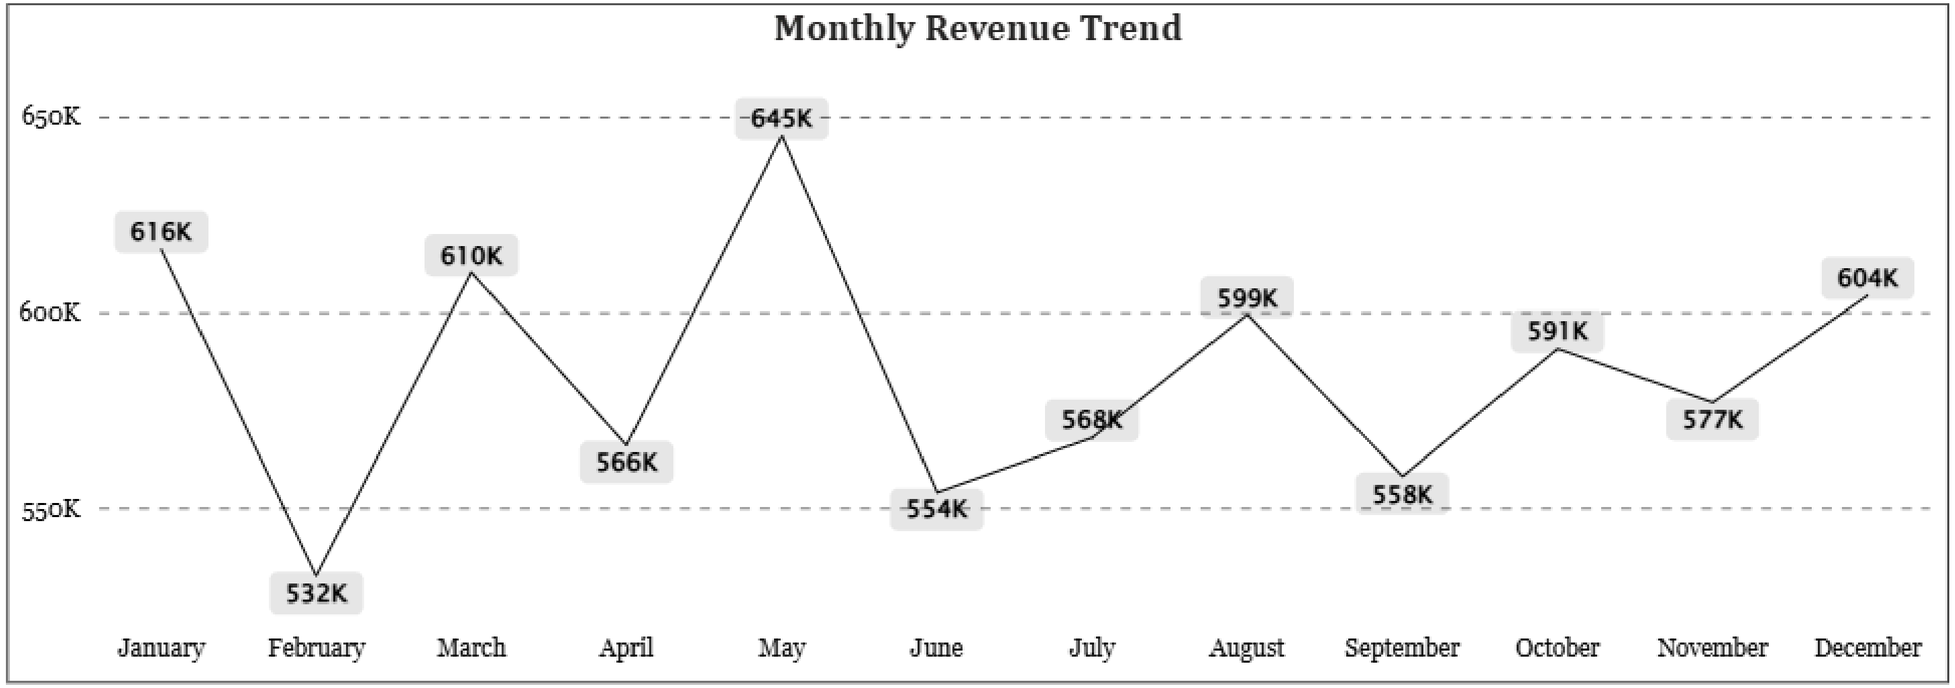
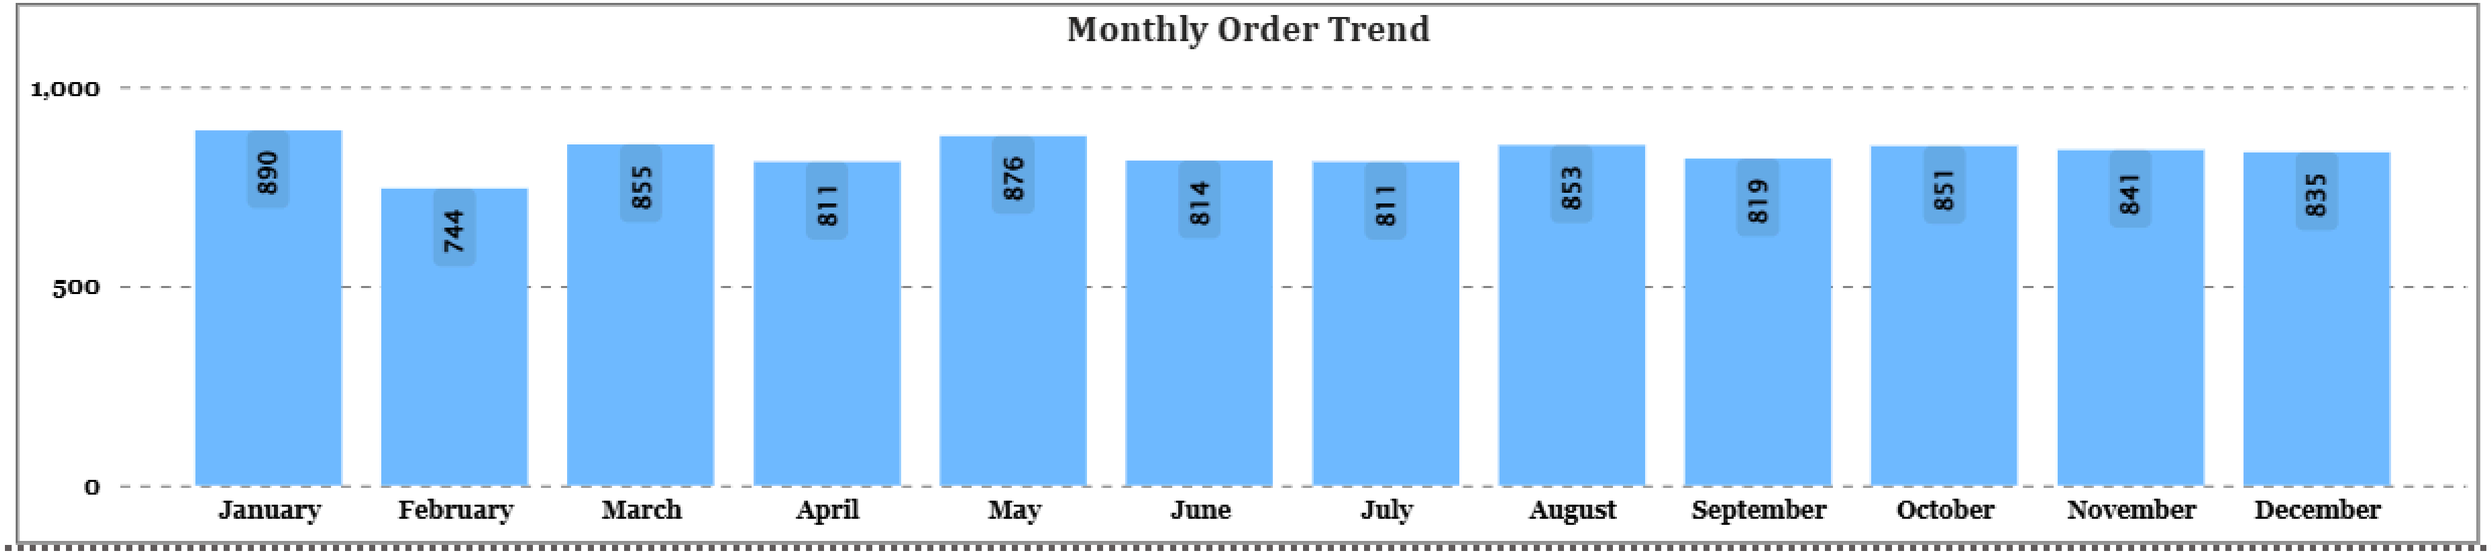
- Himachal Pradesh
- Karnataka
- Maharashtra
- Punjab
- Telangana
- Uttar Pradesh
- Uttarakhand

7M	702.04	10K	2000
Total Revenue	Avg Order Value	Total Orders	Total Customers





Executive Overview

- This page gives a clear summary of overall business performance, showing Total Revenue (7M), Total Orders (10K), Average Order Value (702), and Total Customers (2000). It provides a quick view of how the business is performing.

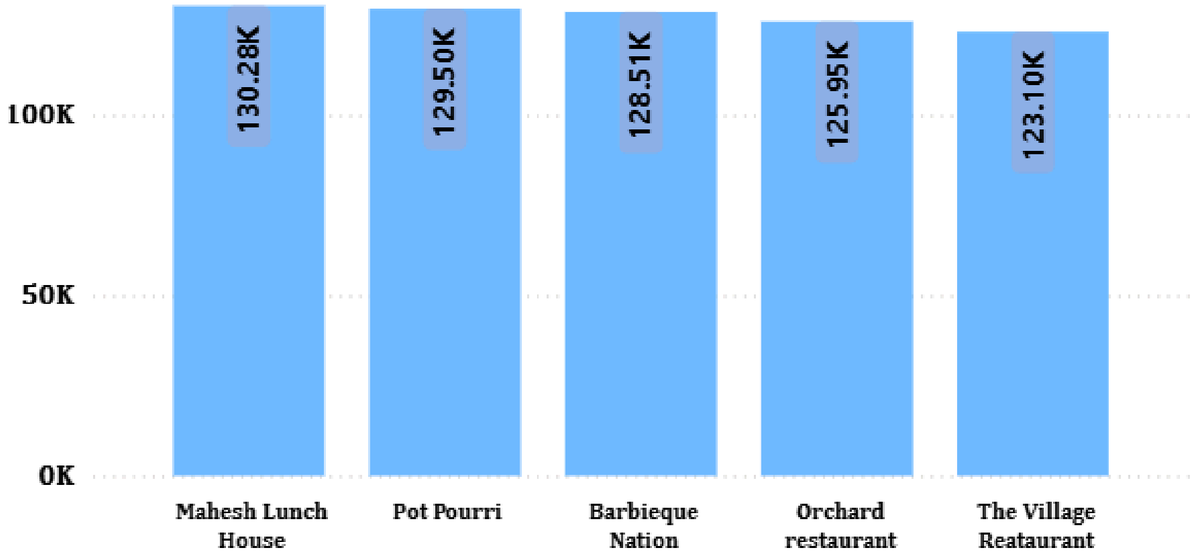
- From the monthly revenue trend, May has the highest revenue (645K), while February has the lowest. Orders remain mostly stable throughout the year, but revenue changes show that customer spending varies across months.

- Using the state slicer, we can see which states contribute the most revenue and compare performance month by month.

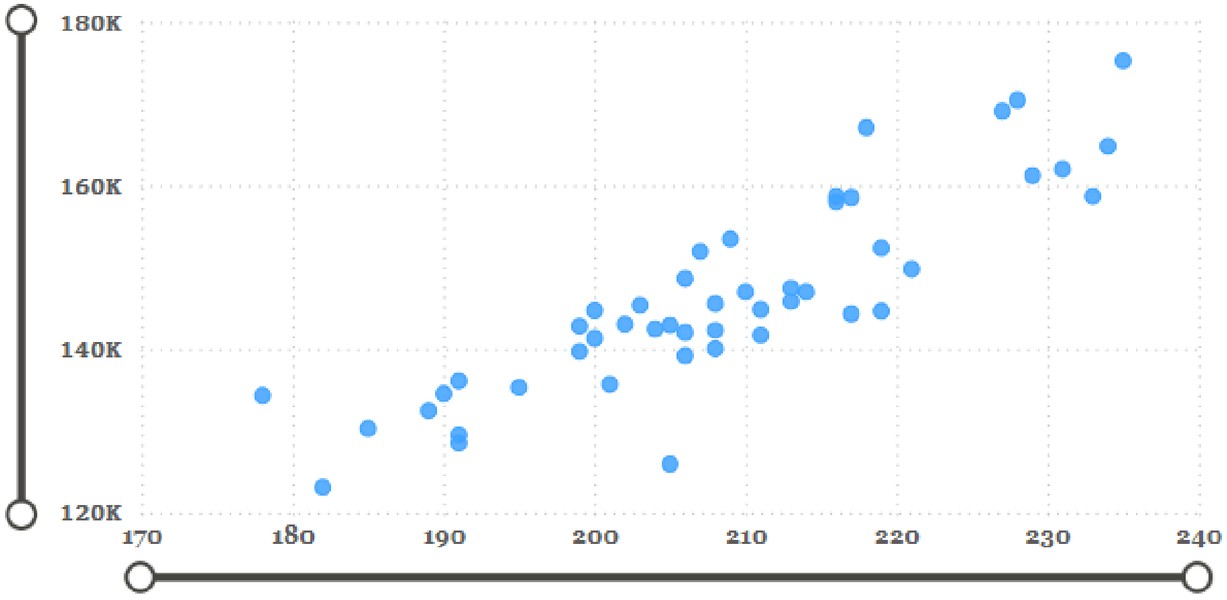
- Overall, this dashboard helps track growth, identify peak months, and understand whether revenue changes are due to order volume or customer spending.

Top 5 Restaurant

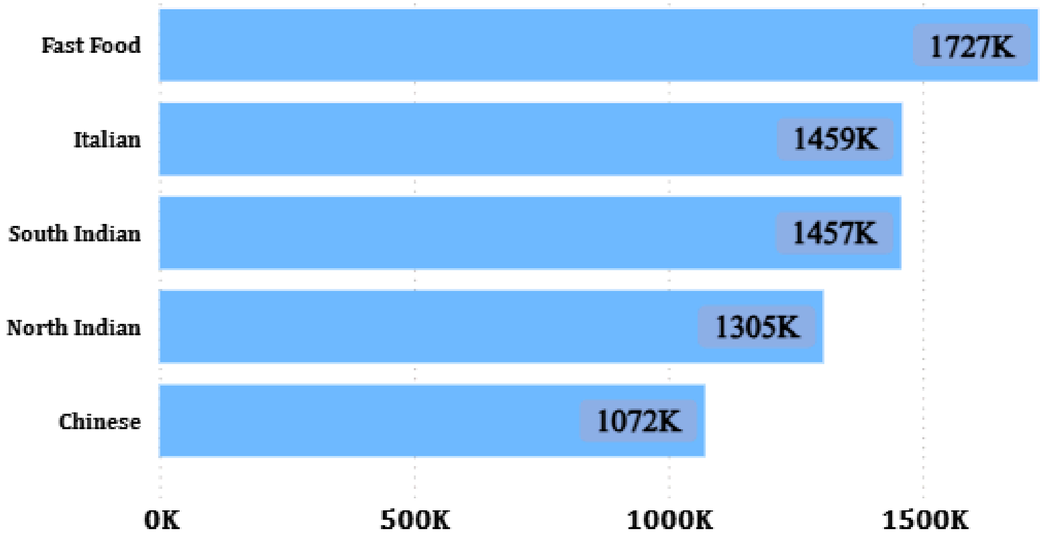
Bottom 5 Restaurant



Revenue vs Orders



Revenue by Cuisine



Restaurants Performance Analysis

- This page shows the performance of restaurants and cuisines. It highlights the Top 5 and Bottom 5 restaurants based on revenue, helping us see which restaurants are performing well and which need improvement.

- Low-performing restaurants may need better marketing, improved food quality, pricing changes, or better customer experience.

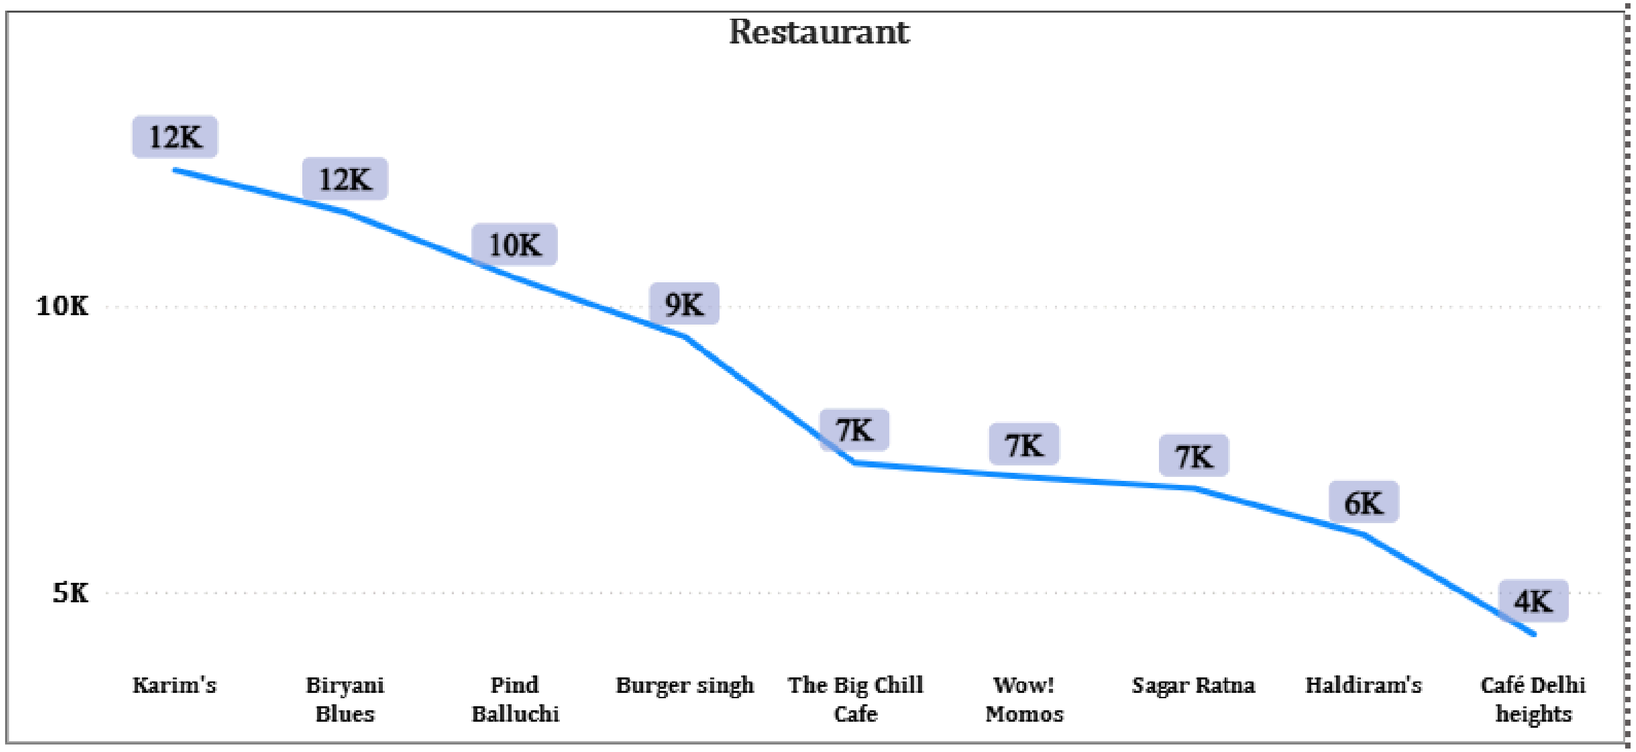
- The Revenue vs Orders chart shows the relationship between orders and revenue. It clearly indicates that restaurants with more orders usually earn higher revenue.

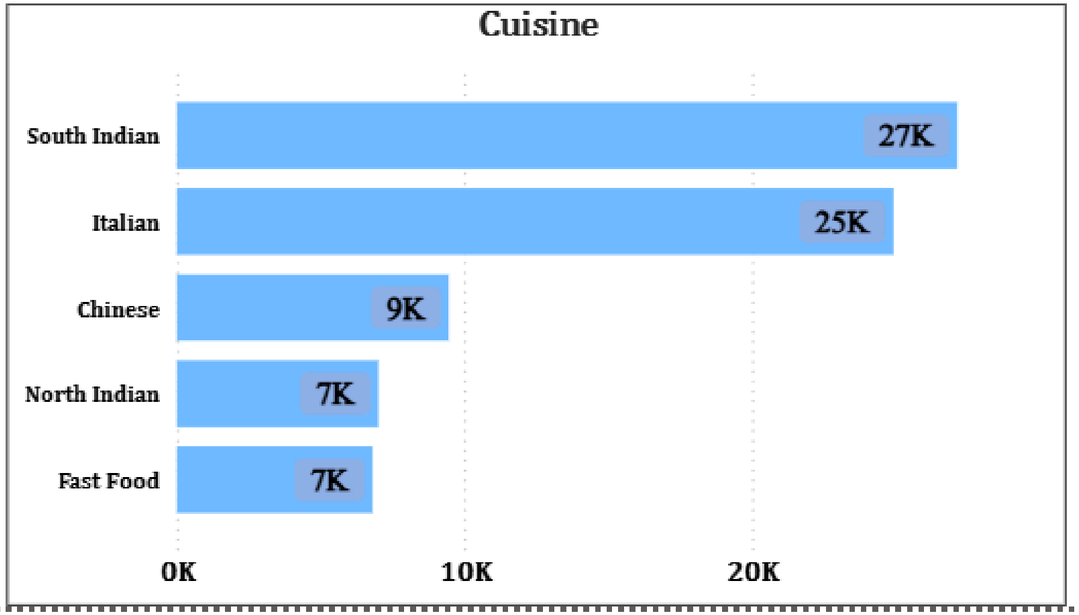
- The Cuisine chart shows customer preferences. Fast Food generates the highest revenue, followed by Italian and South Indian cuisines. This helps the business focus more on popular cuisines and improve weaker areas.

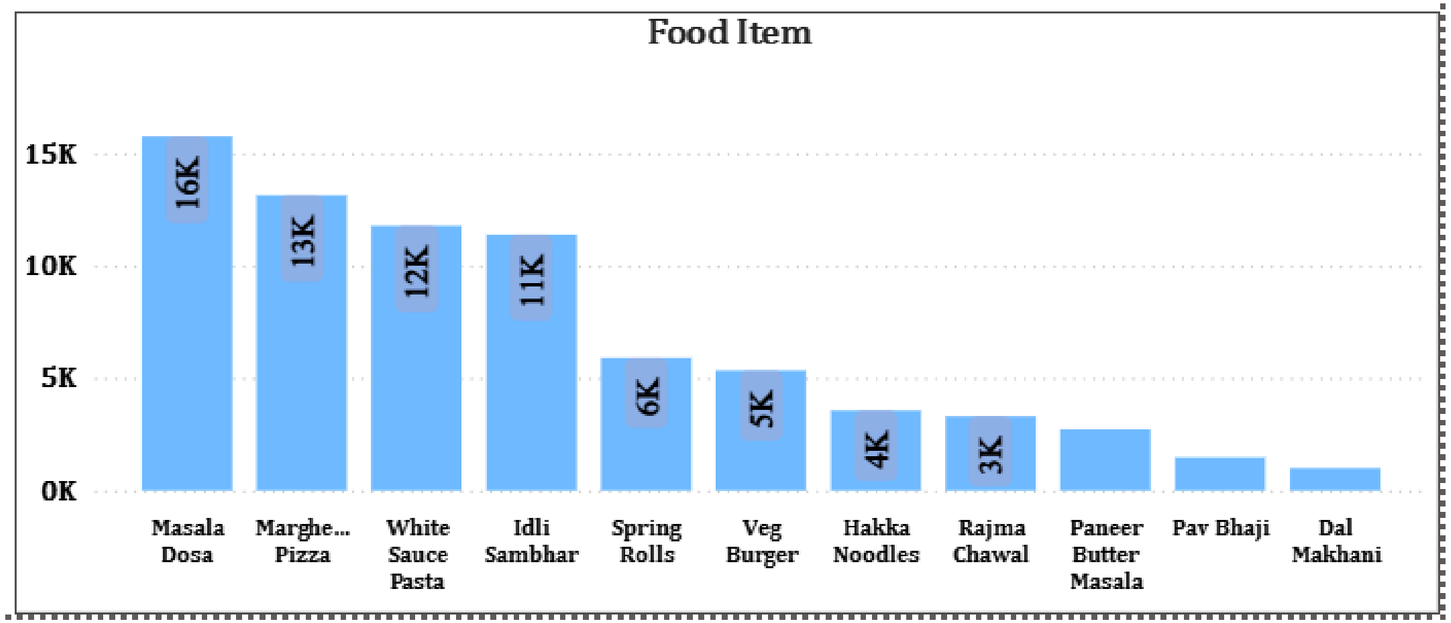
- Overall, this page helps in identifying strong performers, improving weak ones, and understanding customer demand.

10	12	14	16	18	20	22
11	13	15	17	19	21	23

Chandigarh	Karnataka	Telangana
Delhi	Maharashtra	Uttar Pradesh
Himachal Pradesh	Punjab	Uttarakhand







Time & Location Performance Analysis

- This page shows performance based on hour and state. It helps us understand when and where restaurants are earning the most revenue.

- We can see:

1. At which hour orders are highest
2. Which restaurant performs best at a particular time
3. Which state generates more revenue
4. Which cuisine is most popular in each state
5. Which food items are most preferred

- This analysis helps solve important business problems. It helps in managing staff during peak hours, focusing on popular states and cuisines, promoting best-selling items, and improving or removing low-performing dishes.

- Overall, this page helps the business make better decisions by understanding customer behavior based on time, location, and food preference.

Average Order Value per Month

```sql
SELECT
    MONTH(order_date) AS Sno,
    MONTHNAME(order_date) AS Month_name,
    ROUND(AVG(total_amount), 2) AS Average_revenue
FROM orders
GROUP BY Sno, Month_name
ORDER BY Sno;
```

Result Grid | Filter Rows:

sno	Month_name	Average_revenue
1	January	692.27
2	February	715.61
3	March	713.61
4	April	697.81
5	May	736.36
6	June	680.41
7	July	700.19
8	August	702.66
9	September	681.24
10	October	694.07
11	November	685.92
12	December	723.69

- This analysis calculates the Average Order Value (AOV), showing how much customers spend per order and which month has the highest or lowest AOV.
- By comparing months, we can identify strong and weak performance. If AOV is low, it may be due to higher discounts or lower customer spending.
- This helps the business improve sales and increase spending in weaker months.

Revenue contribution of Restaurants Percentage-wise

```sql
SELECT restaurant_name,
    ROUND(SUM(total_amount)/(SELECT SUM(total_amount) FROM orders) * 100, 2)
    AS Percentage_contribution
FROM Restaurant AS r
JOIN Orders AS o
ON r.restaurant_id = o.restaurant_id
GROUP BY Restaurant_name
ORDER BY Percentage_contribution DESC
LIMIT 5;
```

Result Grid Filter Rows:

restaurant_name	Percentage_contribution
kalsang cafe	2.50
desi vibes	2.43
Meghana Foods	2.41
Kesar Da dhaba	2.38
Family Tree House	2.35

- This query shows the percentage revenue contribution of top restaurants. It helps identify major revenue drivers and understand whether the business is dependent on a few restaurants for overall growth.

High order value always have high revenue?

```sql
SELECT
    MONTH(order_date) AS sno,
    MONTHNAME(order_date) AS Month_name,
    COUNT(order_id) AS Count_orders,
    SUM(total_amount) AS total_revenue
FROM orders
GROUP BY sno, Month_name
ORDER BY sno;
```

Result Grid | Filter Rows: | Export:

sno	Month_name	Count_orders	total_revenue
1	January	890	616123
2	February	744	532411
3	March	855	610136
4	April	811	565922
5	May	876	645049
6	June	814	553850
7	July	811	567852
8	August	853	599371
9	September	819	557935
10	October	851	590650
11	November	841	576856
12	December	835	604282

- From the result, we can see that higher orders usually increase revenue, but not always. For example, May generated the highest revenue even with fewer orders, which means customers spent more per order.

- This shows that revenue growth depends on both order volume and customer spending. The business should focus on improving AOV in weaker months to increase overall revenue.

Customer Segmentation

```sql
SELECT c.customer_id, c.customer_name, SUM(o.total_amount) AS total_revenue,
CASE
    WHEN SUM(o.total_amount) >= 5000 THEN 'High Value'
    WHEN SUM(o.total_amount) BETWEEN 2000 AND 4999 THEN 'Medium Value'
    ELSE 'Low Value'
END AS customer_segment
FROM customer AS c
JOIN orders AS o
    ON c.customer_id = o.customer_id
GROUP BY c.customer_id, c.customer_name
ORDER BY total_revenue DESC;
```

Result Grid | Filter Rows: | Export: | Wrap Cell Content:

customer_id	customer_name	total_revenue	customer_segment
1	Customer_1	4371	Medium Value
2	Customer_2	5091	High Value
3	Customer_3	8285	High Value
4	Customer_4	7830	High Value
5	Customer_5	4929	Medium Value
7	Customer_7	9178	High Value
11	Customer_11	3540	Medium Value
12	Customer_12	4129	Medium Value
14	Customer_14	4184	Medium Value
15	Customer_15	5318	High Value
18	Customer_18	3878	Medium Value
19	Customer_19	4818	Medium Value
20	Customer_20	3734	Medium Value
23	Customer_23	6428	High Value
25	Customer_25	3401	Medium Value
27	Customer_27	3747	Medium Value

- This query segments customers into High, Medium, and Low value based on their spending. It helps identify which customers generate most revenue.
- The business can reward high-value customers and create strategies to convert medium customers into high-value customers, improving overall profitability.
